

RNO NCS parameters

Absolute Signal Strength Threshold (dBm)

This is the default value for the "Absolute SS" entry field in the NCS - New Recording dialog box. It is the default value for the Absolute Signal Strength Threshold in dBm.

Type: Integer

Value range: -110 - -47 dBm

Installation setting: -75 dBm

Relative Signal Strength Threshold (dB)

This is the default value for the "Relative SS" entry field in the NCS - New Recording dialog box. It is the default value for the relative signal strength threshold in dB.

Type: Integer

Value range: -63 - 63 dB

Installation setting: 3 dB

STS data collection period (No. of Days)

This is the duration for which STS-data is collected for a NCS result. The time period ends at the end of the day before the measurement result. It starts the number of days before that end time, as defined by the STS data collection period parameter.

Type: Integer

Value range: 0 - 31

Installation setting: 15

Multi Band Cell Offset (db)

This parameter only applies to Multi Band Cells, and is used for evaluating measurement reports

from mobile stations that are served by a frequencies in a non-BCCH frequency band.

The offset moves the cell border for the frequencies in the non-BCCH band, to roughly the same

border as for frequencies which belong to the same band as the BCCH-frequency.

The Multi Band Cell Offset defines the offset in dB to be added or subtracted to the relative

signal strength threshold above which measurement results are counted and evaluated compared

to the signal strength of the serving cell. When the BCCH-frequency belong to a generally stronger

band (GSM800 and GSM900) a positive offset is used for measurements from frequencies in the

generally weaker band (GSM1800 and GSM1900). If the opposite is true a negative offset will be used.

The parameter will only be shown in the NCS and NOX recording definition windows if there are

Multi Band Cells in the OSS system.

Type: Integer

Value range: -40 - 40 dB

Installation setting: 7 dB

Used by: NCS and NOX
